Machine Learning with K-means Clustering

For this project, we use a real dataset that contains statistics, in arrests per 100,000 residents for assault, murder, and rape in each of the 50 US states in 1973. It also provides the percent of the population living in urban areas.

The goal is to determine which states are the best place to live as indicated by those with the least amount of violent crime in murder and assault.

Dataset

https://www.kaggle.com/deepakg/usarrests/home (https://www.kaggle.com/deepakg/usarrests/home)

```
In [4]: import matplotlib.pyplot as plt
import pandas as pd
```

Data

The dataset contains information per 100,000 of Murder, Assault, Urban population, and Rape. But as this is a regression project, we'll deal with the numerical features we have:

Columns 0,3,& 4 are excluded from analysis.

```
In [5]: # Import the dataset
   dataset = pd.read_csv('USArrests.csv')
In [6]: dataset.head()
```

Out[6]:

	Unnamed: 0	Murder	Assault	UrbanPop	Rape
0	Alabama	13.2	236	58	21.2
1	Alaska	10.0	263	48	44.5
2	Arizona	8.1	294	80	31.0
3	Arkansas	8.8	190	50	19.5
4	California	9.0	276	91	40.6

```
In [9]: # Creating X
X = dataset.iloc[:, [1,2]].values
```

The Elbow Method and the WCSS

Within Cluster Sum of Squares (WCSS) is used to determine the distances between centroids and each point and squaring it.

The elbow method is used to determine the optimal number of clusters.

3 clusters are recommended.

The selection of the centroids at the beginning of the algorithm can potentially dictate the outcome of the centroids. The K means++ resolves this. Inertia is a function that computes the WCSS.

```
In [10]: # Using the elbow method
    from sklearn.cluster import KMeans
wcss = []
    for i in range(1, 11):
        kmeans = KMeans(n_clusters = i, init = 'k-means++', random_stat
e = 202)
        kmeans.fit(X)
        wcss.append(kmeans.inertia_)
plt.plot(range(1, 11), wcss)
plt.title('The Elbow Method')
plt.xlabel('Number of clusters')
plt.ylabel('WCSS')
plt.show()
```

```

Where to Live?

There are three distinct clusters indicated by the algorithm. The safest place to live would be in the green states where murders per 100,000 and assaults are at their lowest. Red has a medium amount of violent crime and blue states have the highest number of murders and assaults.

For those looking at relocating and to whom the number of violent crimes is a concern, the green states and some of the red are recommended. With the blue states being ones to avoid.

Where to Live Part 2

To examine a specific state we would compare the y_means variable to the dataset. For example, the first 3 digits in the y_means are in cluster 1, which is considered "high". Alabama, Alaska, and Arizona have high crime rates according to this model. Arkansas is item 4 in our y_means array and a 2 which is "medium" crime. Connecticut is a 0, "Low" crime.
